

IQVIA Remote Research Clinicians

High-quality, credentialed remote clinicians providing compassionate protocol-required care to patients in their homes

The human touch of tech-enabled trials

Sites and trial participants have become familiar with decentralized study elements that alleviate the burden, expand the recruiting radius where regulations permit, and offer participants engagement opportunities on their terms. However, there are still times when visits require a human touch, when trained professionals are utilized to perform specific research activities in a home environment.

IQVIA Remote Research Clinicians deliver mobile research nurses, dietitians, and phlebotomists to support studies worldwide. These professionals engage patients where they live, providing protocol-required in-home research services that enhance study quality and meet trial needs. Our global network of clinicians is trained to perform protocol-specific tasks in compliance

with their country's regulatory requirements — benefiting sponsors, sites, and patients alike. This service is available as a stand-alone offering or as part of a broader solution.

Patient-centered Care in Practice

Enhance patient engagement

Remote Research Clinicians offers patients flexibility to choose at-home study visits which makes clinical trial participation more attractive and strengthens engagement.

Drive efficiency and quality

IQVIA's mobile study teams are equipped with training and quality oversight to ensure each visit counts, driving efficiency from first patient in to last patient out.

Deliver adaptability, globally

Mobility brings its own logistical hurdles. Mobile study teams like Remote Research Clinicians help expand the radius of the clinical site while also adhering to strict privacy rules and compliance regulations.

Who Remote Research Clinicians support

Remote Research Clinicians project managers coordinate and operationalize in-home visits, allowing site staff to focus on more complex study responsibilities. Our qualified registered nurses are trained on study protocols, assessments, and specific requirements. Before the first visit, principal investigators and site staff receive the nurse's credentials and may request an introductory meeting.

Source documentation is provided for site review within 24–48 hours of each visit and undergoes a Good Clinical Practice

(GCP) review before finalization. By managing less complex visits, remote nurses help reduce site burden and free up staff time for higher-priority tasks.

Patients value the convenience of in-home services, reporting shorter travel and wait times, greater comfort, and a more personalized experience. These benefits contribute to improved patient participation, lower dropout rates, and enhanced diversity in clinical trials.

Remote Research Clinicians also support direct-to-patient delivery and administration of investigational products, along with data and specimen collection.
